

INTEGRATION

Direct Integration of Water Tickets Saves Supermajor 300 + Hours A Week in Oilfield

Managing Water Tickets from Transporters

The largest supermajor is saving 300 plus hours a week in one of its Permian oilfields by moving from manual entry of water tickets to direct integration on JOYN's vendor API. Before, water transporters collected water and left behind paper tickets generated on their own software tools. The lease operator also received water ticket details as an auto generated email from transporter. These details, such as volume, time and date etc., were then manually entered in production accounting system. The process was cumbersome, time consuming and prone to error.

CASE STUDY

Lease Operators Approve Water Tickets on JOYN

Now, with JOYN's vendor API, third-party water tickets are directly integrated and available for lease operators to review on their JOYN app. They first validate the data and then either approve or reject the water ticket. If approved the ticket is pushed to the production accounting system instantly. If rejected the record is removed and a notification is sent to the vendor for corrective action.

Time Saved, Process Optimized

Direct integration of Water Tickets on JOYN has simplified the process, reduced manual intervention and brought the field workers, supervisors, production accounting teams and even the water transporters on the same page. With JOYN's cloud-based APIs directly pulling data from transporter's system and alerting the transporter of data mismatches, the process is relatively error free and saving the supermajor over 300 hours a week.
