

SCALABILITY

Simple Configuration on JOYN Eases Well Problem Communication

Spreadsheet Based Processes Hinder Visibility

The largest supermajor was challenged with visibility on well problems across their Permian assets and was losing opportunity to prioritize high value wells. The process involved manual entry of well issues on disparate spreadsheets that lacked visibility to gain trust and credibility across the organization. This resulted in issues remaining open for longer than desired and mounting opportunity costs impacting the bottom line.

No Coding, Minimum Configuration, High Visibility Communication

The issue of visibility on well problems was resolved with a simple configuration of a well problem form on JOYN within minutes. Now the field personnel fill out lift type, suspected failure, downtime recorded and their comments. The well problem auto syncs to the cloud where a live report of all well problems is accessible by everyone from the lease operator to foremen, supervisors and technicians. With simple configuration and ease of use, the solution is easily replicable in other oilfields, adding more users as operations expand.

Quicker Resolution, Higher Production, Minimize Lost Opportunity

Every function in the field and in the office has clear visibility of issues real-time. The high value wells having issues are now prioritized based on their production potential and addressed swiftly to ensure the lowest cost production uptick.
